Statistical inference uses the language of probability to say how trustworthy our conclusions are. We learn two types of inference: confidence intervals and hypothesis tests . We construct a confidence interval when our goal is to estimate a population parameter (or a difference between population parameters).

Statistical inference is the process of using data analysis to deduce properties of an underlying distribution of probability. Inferential statistical analysis infers properties of a population, for example by testing hypotheses and deriving estimates. It is assumed that the observed data set is sampled from a larger population.. Inferential statistics can be contrasted with descriptive statistics.

### **STATISTICAL INFERENCE**

Statistical inference always involves an argument based on probability. In this court case, the prosecution used two different types of arguments to provide evidence of cheating. The first argument is an example of statistical inference because it is based on probability. We set up a simulation to reflect an assumption that the prosecutor made.
